

Smart Inventory

XS InfoSol Inc.

www.xsinfosol.com

Benefits

Benefits

Smart Inventory

■ Improve Inventory Visibility

Inventory Management allows you to consolidate your disparate inventory tracking and control systems into a single, global inventory management solution for material in every stage of the product or production lifecycle as well as for your different business types. For manufacturers and distributors, this visibility is not limited to current state balances but also includes global track and trace information including inventory source and where-used analysis.

■ Reduce Inventory Levels

Inventory Management gives you a variety of tools to reduce your inventory levels. The more accurate your inventory levels and efficient your replenishment, the less safety stock you need to hold. The more proactive your exception management, the more readily you can respond to shortages, quality issues and backorders before costly expediting is required.

■ Control Multi-Mode Inventory Operations

Whether you are running manufacturing centers, distribution centers, service depots, spare parts warehouses or other types of parts storage facilities, Inventory Management provides the multi-mode inventory capability that helps you control all your inventory operations. Comprehensive material and transaction attributes capture gives inventory managers and operators flexible visibility into material aging, qualitative characteristics, material status, and material consigned from suppliers.

Keeping track of
what's selling is easy

Features

Features

Smart Inventory

■ Monitoring

Inventory management systems monitor inventory levels across all locations, internal and external. Every transaction that moves inventory from one location to another, either internally or externally, affects the level of inventory in one or more locations is captured.

■ Tracking

Besides monitoring inventory levels, inventory management system also tracks every movement of inventory---from receipts into the warehouse, goods issued out of the warehouse, movement between storage locations, picking and packing movements and any other movement from one location, physically or virtually, to another location.

■ Automation

Inventory management systems should automate certain functions of a warehouse operation. Some inventory management systems automate routine functions such as physical inventory reconciliation, cycle counting, order fulfillment and transportation and logistics functions. Systems that automatically generate inventory management statistics such as life cycle information help inventory managers and other users make more informed purchasing and distribution decisions.

■ Optimization

Inventory management system gives users the data required to optimize inventory levels and warehouse space. Various reports available from the system provide users with information on fast-moving inventory, slow-moving inventory, inventory reaching its expiration date and "dead" inventory. This information lets users scale the volume of future purchases up or down to optimize SKU level inventory. It also allows users to optimize warehouse receiving, picking, packing and shipping by storing the faster moving items to locations closer to the point-of-use.

Features

Features

Smart Inventory

■ Reporting

Inventory management system also provides reliable reports that are easy to generate and understand. The system provides detailed reports of various inventory statistics such as usage, aging, turns, inventory valuation, FIFO/LIFO statistics, cost basis, amount on-hand in units and dollars, amount on order in units and dollars, amount in-transit in units and dollars, amount in work-in-process in units and dollars and also various supplier-related data such as on-time shipment receipts.
